Supplementary figures and tables

Figure S1: Scatter plots of the relation between PPV calculated with the classic algorithm (PPV_{Classic}) and the stroke volume response (ΔSV) to a 250 ml fluid challenge. Panels are arranged with tidal volumes (VT) in rows and respiratory rates (RR) in columns . One fluid challenge was evaluated for each subject (n = 50), while PPV_{Classic} was calculated for each of the 10 ventilator settings.

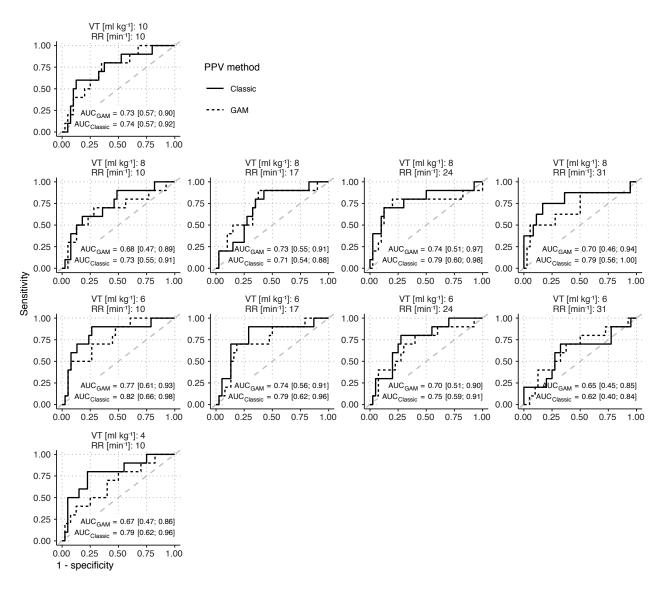

Figure S2: Receiver operating characteristic (ROC) curves for capacity of pulse pressure variation (PPV) to classify fluid responsiveness (stroke volume change > 10%). Panels are arranged with tidal volumes (VT) in rows and respiratory rates (RR) in columns. One fluid challenge was evaluated for each subject (n = 50), while PPV_{GAM} and PPV_{Classic} was calculated for each of the 10 ventilator settings.

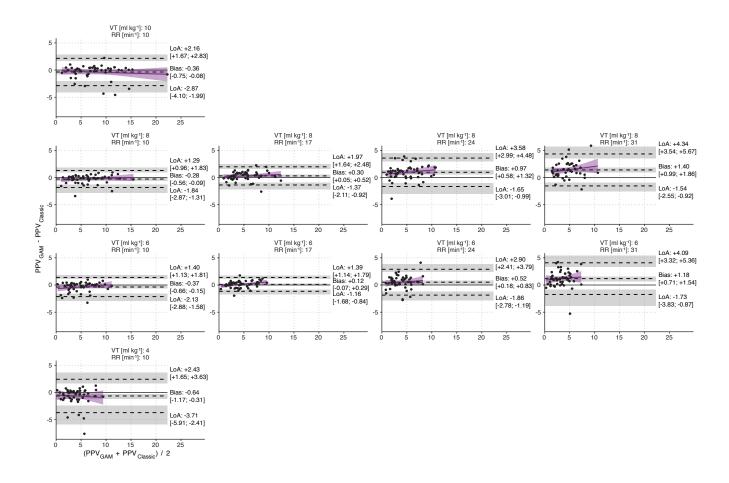

Figure S3: Bland-Altman plots showing the relation between PPV_{GAM} and $PPV_{Classic}$. The outer dashed lines represent 95% limits of agreement (LoA). Grey areas are 95% confidence intervals for bias and LoA. The purple lines and areas are linear regression fits with 95% confidence intervals. Panels are arranged with tidal volumes (VT) in rows and respiratory rates (RR) in columns.

Figure S4: (Extended version of the paper's Fig. 5): Parameter estimates for a Bayesian mixed-effects model, describing the effect of tidal volume (VT) and respiratory rate (RR) on pulse pressure variation (PPV). Parameters are estimated for both PPV derived using a generalized additive model (GAM) and using a classic approach (Classic). Panel **a** presents the observed PPV values (outcomes) using each method (n=507 for both GAM and Classic). Vertical bars are 95% compatibility intervals. Panel **b**, **c** and **d** present parameter estimates. Vertical bars are 95% compatibility intervals. Panel **e** shows model residuals, and panel **f** shows the residual variation relative to the estimated value of PPV.

Table S1

Receiver operating characteristic analysis of fluid-responsiveness prediction using pulse pressure variation (PPV). A positive fluid response was a >10% increase in stroke volume from a 250 ml fluid bolus. PPV was calculated using a classic method and derived from a generalized additive model (GAM). Results are presented as estimate [95% confidence interval].

	GAM PPV				Classic PPV
